[Hiring Manager]

[Company Name]

[Role Title]

Dear [Hiring Manager],

Last year, my team replaced a company's SAP/Navision ERP with a system I architected and built from scratch — database to frontend to deployment — for a palm oil refinery in Sabah. Not a prototype, not a pilot: production software that a government-linked refinery runs on, for supply chain, finance, HR, procurement, and manufacturing execution. That is the kind of problem I want to solve for [Company] in [Role].

I bring the stack [Role] asks for, with evidence behind every line. My enterprise .NET foundation comes from extending **Microsoft Dynamics AX** with custom plugins — financial workflows on SQL Server. I keep the C# sharp today: a publicly released mod with **526 automated tests**, 0 warnings, and its own installer and release pipeline. On the web side I ship Nuxt 3 / Vue 3 / TypeScript / Prisma systems daily, and I run a live **real-time trading pipeline** (Python/FastAPI/ML) — the kind of always-on discipline that MES and Industry 4.0 roles expect.

One thing my resume doesn't say loudly enough: I audit my own work. When my trading backtest looked profitable for two weeks, I found the leak, published the audit, and rebuilt. I lead teams, wear the BA/PM/Architect hats when needed, and I ship systems that survive contact with reality — because **if it doesn't work for real people, it doesn't ship**.

I'm based in Balik Pulau, Penang, available **full-time, remote or on-site**. I'd welcome the chance to walk you through the ERP in a short call.

Thank you for your time and consideration.

Warm regards,

Mohamad Firdaus bin Mohamad Fauzi
